

Question # 1 : P02-01- Jenny's Salon & Spa

- Create a file called P02-01
- Design the data models below
- Export the file containing the data models as a PDF file and submit

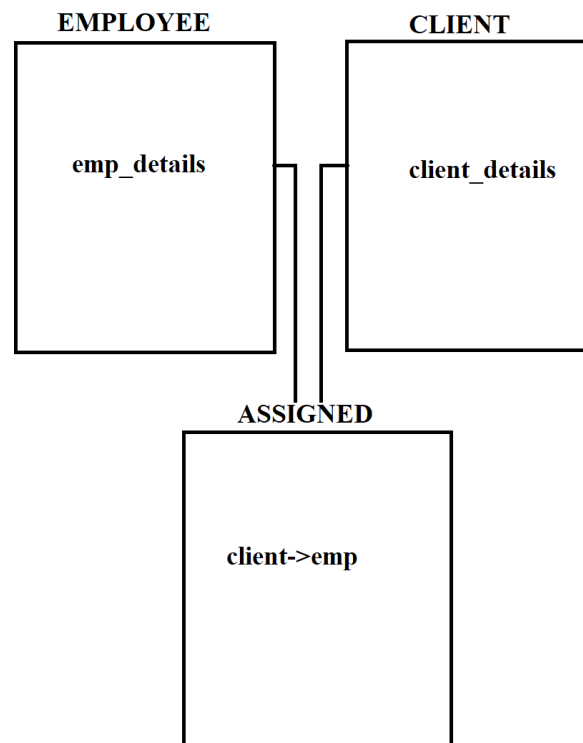

P02-01a

At Jenny's Salon & Spa, we have several hairstylists that are salaried employees. In addition to their salary, we store their first name, last name, social security number, mobile number, and email address. The salon has clients, which they record first name, last name, mobile number, email address, and preferred day. Some clients do not have a preferred day.

P02-01b

Each hairstylist is assigned clients. When a hairstylist is hired, the hairstylist is not assigned any clients during orientation. Each client is asked if they have a preferred hairstylist. If they have no preference, they are assigned a hairstylist that becomes their hairstylist. Of course, they can switch to another hairstylist at any time.

Solution:

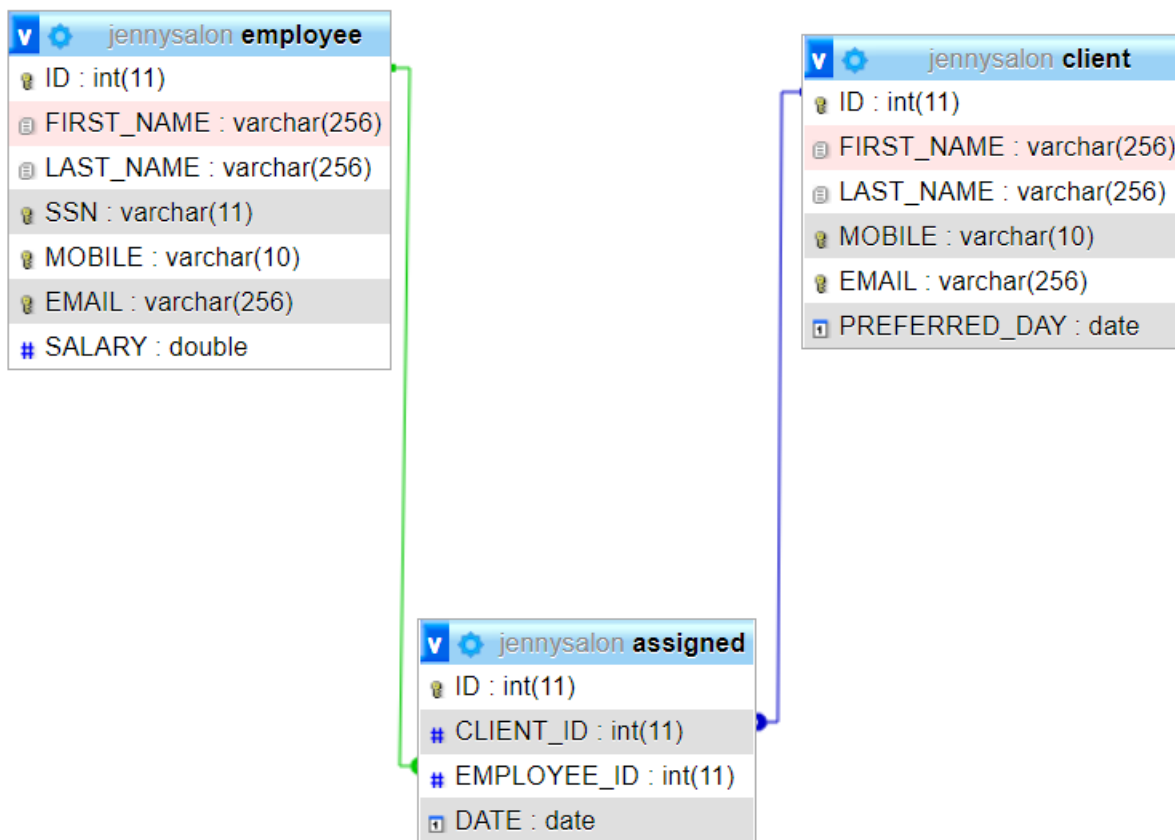

Created a database named "jennysalon", and created three tables namely "EMPLOYEE", "CLIENT", "ASSIGNED", all employees details can be recorded in the employees table and clients details can be recorded in the clients table what all new records coming can be maintained inside the assigned table that contains which client is assigned to which employees and this is linked with client ID and

employee ID client ID and employee ID act as foreign key linked with primary keys of both of those other two tables. Hey whenever new client is added and the client Marks and preferred day hair cutting appointment then one can code do you automatically assign a hair stylist which will be filled inside assigned table this assigned table can be manually edited also if client warns to have an appointment at another time or with another hair stylist

1. In employee table primary key is ID and unique key is Social Security number, mobile and email address
2. In client table primary key is ID and unique keys are mobile and email
3. In assign table primary key is ID and two foreign keys are there client ID and employee ID which is referenced from employee table and client table

This is how ER Diagram looks like

EMPLOYEE TABLE(PRIMARY KEY-ID , UNIQUE KEY-SSN,MOBILE,EMAIL)

Question 2 : P02-02 - Lakeside Assembly Inc.

- Create a file called P02-02
- Design the ER diagrams described below
- Export the file containing both data models as a PDF file and submit

P02-02a

Lakeside Assembly Inc. sells products assembled from parts purchased from various vendors.

For each vendor, vendor id, company name, and contact person are stored. Some vendors do not assign a contact person. For parts, part id, part description, and part cost are stored. For products, product id, product name, and selling price are stored.

P02-02b

Each part is purchased from one specific vendor. Of course, each vendor may supply several parts. Usually, but not always, a vendor relationship is established before any parts are purchased. Each product is assembled from one or more parts. Each part is unique and is used in the assembly of one specific product. Modify the ERD and include the ERD language.

Solution :

I have created total of 5 tables 3(vendor, product, parts) and linking these other 2(vendor_parts,product_parts)

1. In Vendor table will contain the list of vendors, primary key is vendor ID and unique key is company name
2. In Product table it will contain list of products where primary key is product ID and unique key is product name
3. In Parts table there will be list of parts primary key is parts ID and there is no unique key
4. In vendor parts table there will be list of which vendor provides which part here we cannot have unique vendor ID or part ID like multiple vendor can provide multiple parts here we have two foreign keys vendor ID and parts ID which is linked to vendor and parts table
5. In products part table there will be list of products that can be made using different parts here we cannot have anything unique like multiple products can be formed using multiple parts here we have one primary key as ID and two foreign key that is parts ID and product ID linked with parts stable and products tabe
